EXPERIMENT 6

Automating Business Processes Using Deluge Scripting and Workflows, with Testing and Debugging

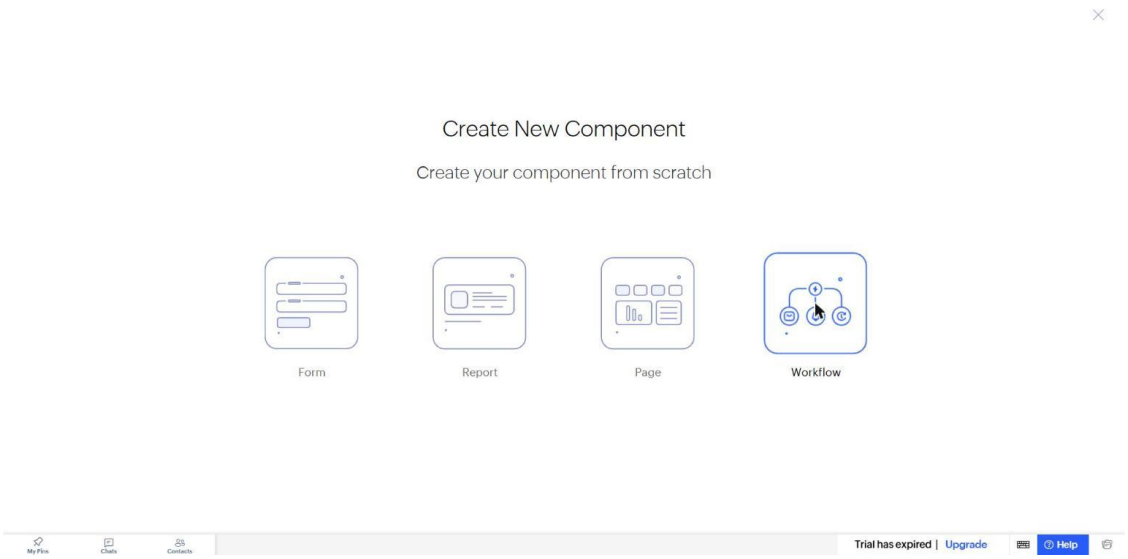

Application: Recruitment & Job Application Management

Aim

To automate a business process in the Recruitment & Job Application Management application by creating a workflow with a Deluge script in Zoho Creator, and to test and debug it.

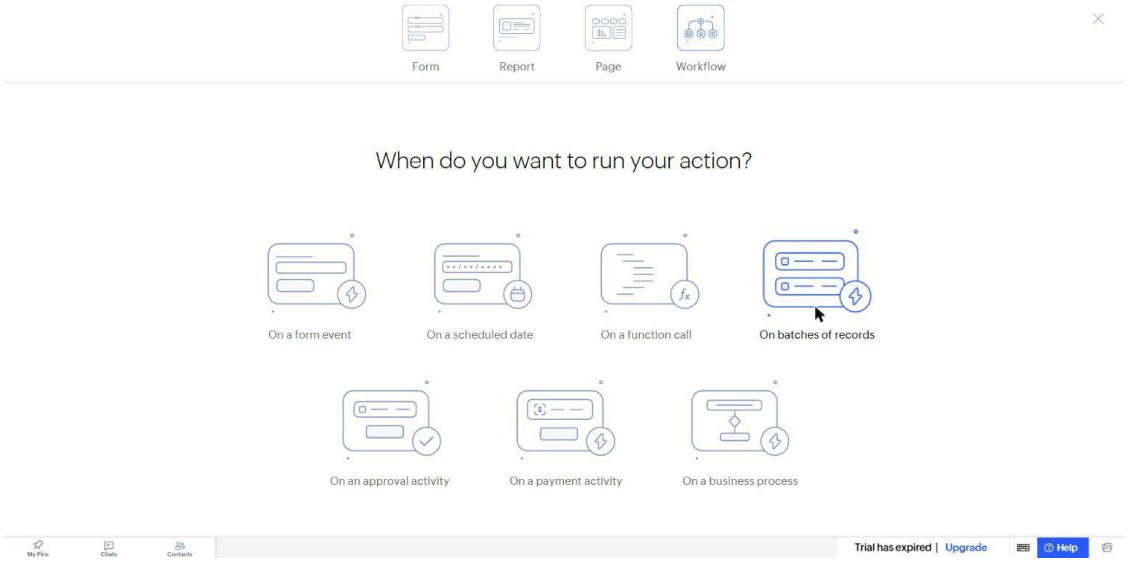

Procedure

1. In the application builder, click the + button and choose **Workflow**

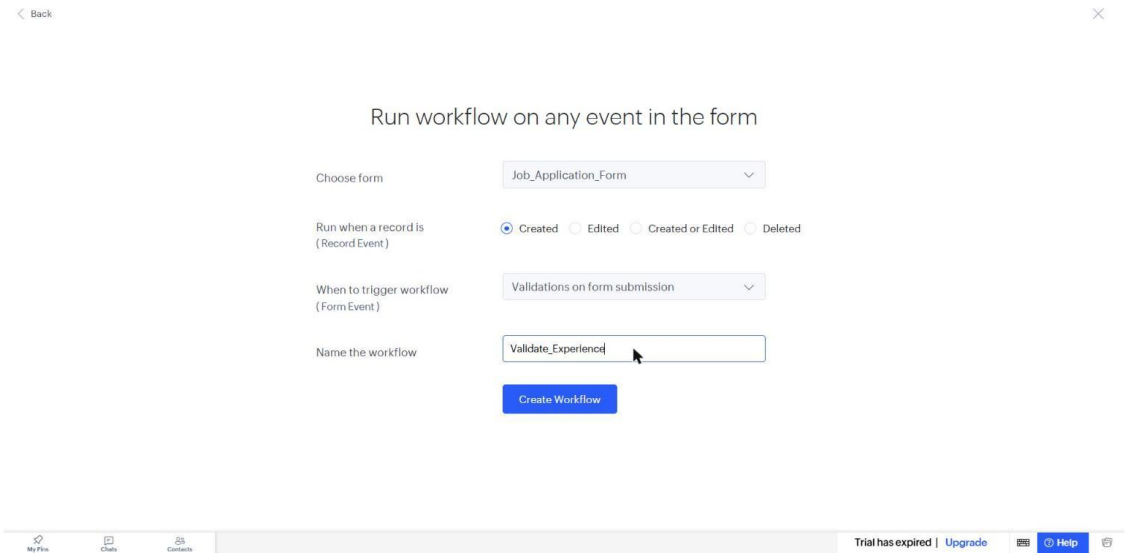

Create New Component menu with Workflow

2. The screen asks when the action should run. Select **On a form event**

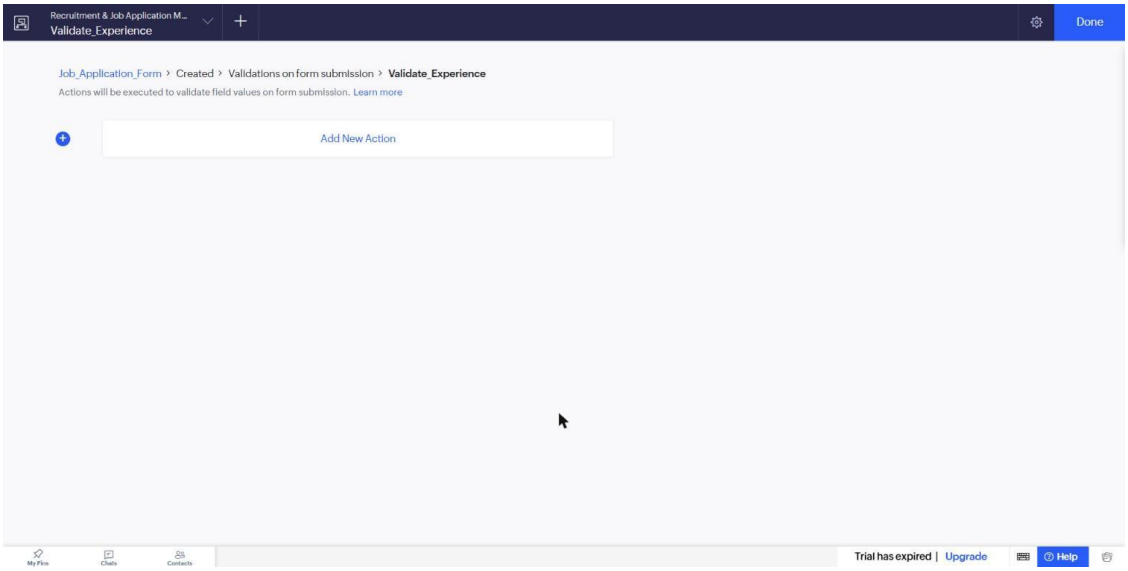

Workflow trigger options

3. Choose the form **Job_Application_Form** and the record event **Created**. Under When to trigger workflow, select **Validations on form submission**. Type **Validate_Experience** in Name the workflow and click **Create Workflow**.

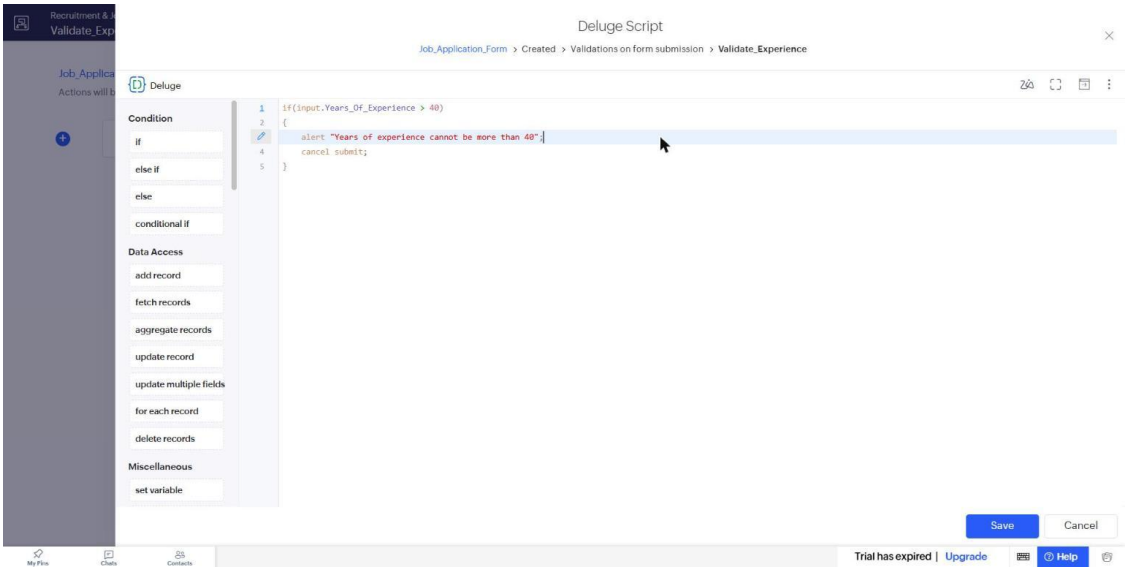

Workflow settings

4. The workflow builder opens Click **Add New Action**.

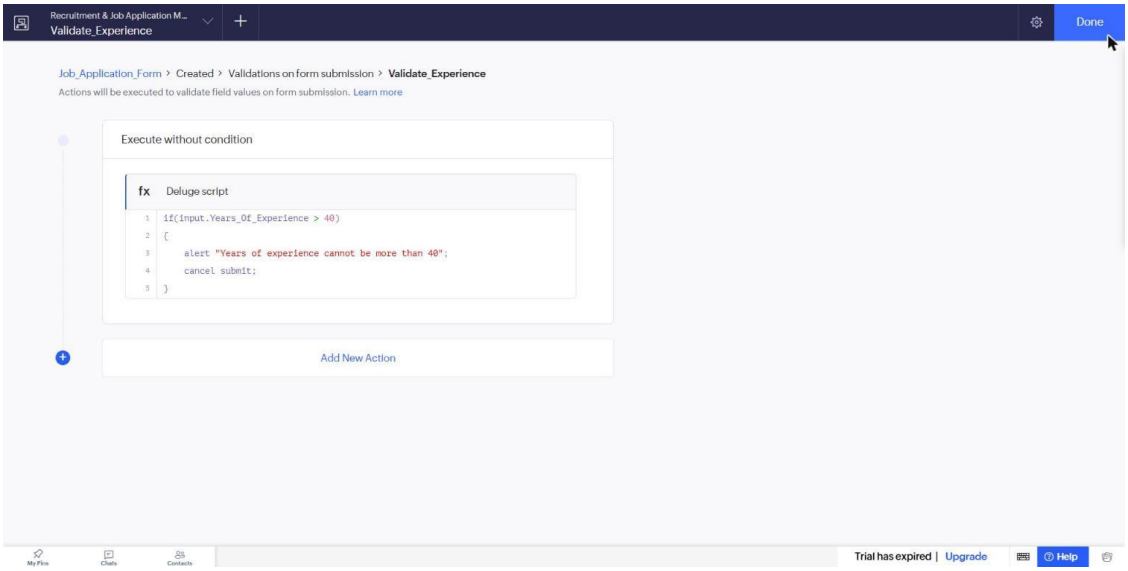

Workflow builder

5. The Deluge Script editor opens. Type the script It checks the value of Years_Of_Experience; if it is more than 40, it shows an alert message and stops the form submission with **cancel submit**. Click **Save**.

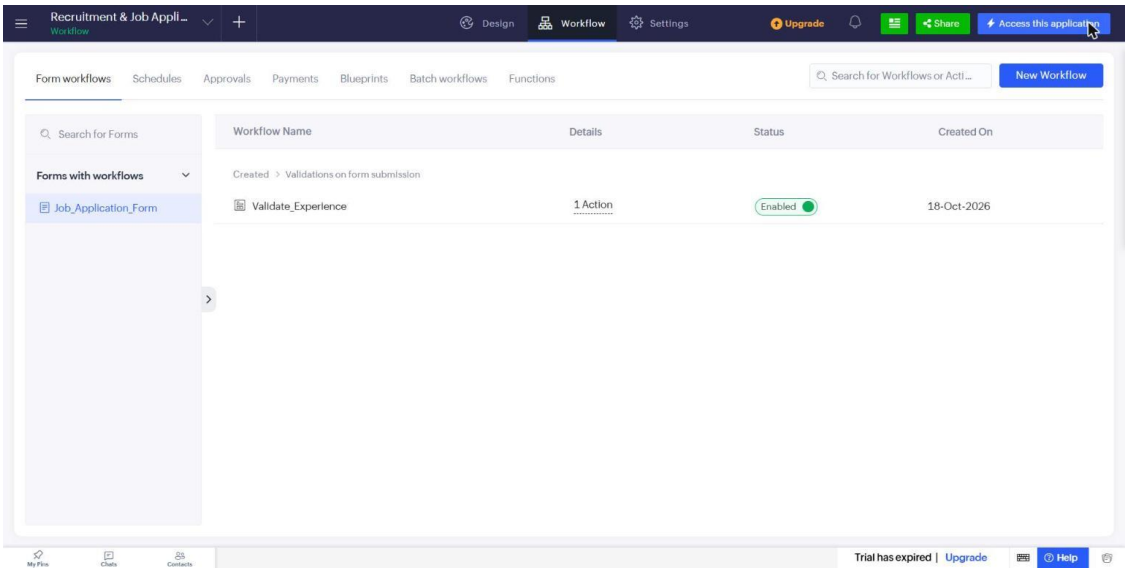

Deluge script in the editor

6. Close the editor. The script appears under Execute without condition Click **Done**.

Script added to the workflow

7. The Workflow tab lists Validate_Experience for Job_Application_Form (Created, Validations on form submission) with 1 Action and the status Enabled

Workflow list showing Validate_Experience enabled

8. For debugging, the editor was checked while typing. Auto-completion added a stray text and an incorrect operator in the first version of the script (an "or" condition for values below 0). The script was cleared and typed again in a simpler form, and the editor then showed no errors.

Result

A form-event workflow named Validate_Experience was created on Job_Application_Form. It runs on form submission and contains a Deluge script that rejects a job application when Years_Of_Experience is more than 40. The workflow was saved and shows as Enabled. The

live application could not be opened for a screenshot in this session, so no test application was submitted and the alert message was not seen on screen. The script was therefore checked only in the editor.
