EXPERIMENT 3

Survey Report on Emerging Trends in Low-Code Application Development

Aim

To study the emerging trends in low-code application development and understand how low-code platforms are used to develop business applications with less manual coding.

Procedure

1. Study the concept of low-code application development and understand how visual tools are used to build applications.
2. Refer to reliable learning resources, such as the official Zoho Creator documentation and Zoho Creator Learning Centre, to learn about current low-code features and developments.
3. Identify important trends such as visual application building, workflow automation, integration through APIs, AI-assisted features, analytics, and improved security and access control.
4. Write a short explanation of each trend in simple language and describe how it may be useful in a business application.
5. Use the Recruitment & Job Application Management system as an example. Explain how a form can collect candidate details, how a workflow could send an acknowledgement email, and how reports can help HR review applications.
6. Compare the benefits of low-code development, such as faster development and easier maintenance, with possible limitations, such as platform restrictions and dependence on the selected service.
7. Organize the information into a survey report with an introduction, trend descriptions, examples, benefits, limitations, conclusion, and references.
8. Capture screenshots of the official learning resources or your prepared report table, and insert them in the appropriate places in the lab record.
9. Prepare a table listing the trends studied, a brief explanation, and one possible use in the Job Application System.
10. Take a screenshot of the completed table in Word, or capture a relevant genuine report page if your instructor requires source evidence.
11. Insert the screenshot above and add a suitable caption. Do not present an unperformed survey as completed research.

Output

A survey report describing emerging trends in low-code application development, including visual development, workflow automation, integrations, AI-assisted features, analytics, and security. The report relates these trends to the Recruitment & Job Application Management system.

Result

The emerging trends in low-code application development were studied and organized into a survey report. The report should be finalized with verified references and the required screenshots before submission.
