EXPERIMENT 15

Report and Presentation on Career Pathways and the Future of Low-Code Development

Aim

To prepare a report and a presentation on career pathways in low-code development and on the future of low-code, using the Zoho Creator work done in this lab.

Procedure

1. The Zoho Creator certification page was read to list the learning and career levels that Zoho offers.
2. Articles on low-code trends for 2026 were read to list the changes expected in the future of low-code.
3. The skills practised in Experiments 1 to 14 were matched with the certification levels.
4. The report was written in this file and the presentation was made from the same points.

Result

Career pathways

Zoho offers three certification levels for Zoho Creator:

1. **Business User Certification:** for non-developers who build simple apps with a few forms and reports using no-code features. Zoho describes it as suitable for a citizen developer or an administrator of an application.
2. **Zoho Creator Certified Developer - Associate:** for a person who knows Creator concepts and can build simple to medium-complexity apps. It is open to everyone, needs no project experience, and is valid for 2 years.
3. **Zoho Creator Certified Developer - Professional:** for developers who plan and build enterprise-grade implementations. It needs at least 1 year as an Associate and several successful medium-complexity customer projects.

Zoho states that certified developers get access to a group of over 700 certified developers for support, and that advanced-certified developers can be listed on the Zoho website to receive direct leads.

Skills from this lab

The lab covered forms and fields (Experiment 4), reports, pages and dashboards (Experiment 5), Deluge workflows (Experiment 6), integrations and connections (Experiment 7), user permissions (Experiment 8), Zia and analytics (Experiment 9), subforms and query tuning

(Experiment 10), Environments (Experiment 11), security and governance (Experiment 12), limits of low-code (Experiment 13) and custom functions (Experiment 14).

Future of low-code

The articles read list these trends for 2026:

1. **AI-assisted building:** describing an app in plain language, with AI drafting it and developers refining it.
2. **AI agents:** agents that plan and complete multi-step tasks across systems.
3. **Governance:** human review, role-based access and audit trails, because AI-generated code can carry security risks.
4. **Citizen developers and fusion teams:** business users build apps alongside IT, and IT sets the rules.
5. **Low-code with pro-code:** low-code is used as a front-end layer over older systems, and traditional code is used where needed.
6. **Other trends:** hyperautomation, industry-specific platforms, DevOps features such as version control and sandboxes, and fewer governed platforms in each company.
